# Project

# REPORT

**December 026, 2025**

---

1st semester **Session: 2025 – 2029**

**Courses:** AICT and PF

## PROJECT TITLE

Events Management System for Universities

**Tools used:**

AICT(FRONTEND): HTML, CSS and JavaScript

PF(BACKEND): Python, JSON and Flask

**Submitted by:**

MUHAMMAD AMIR 2025-DS-35

ABDUL REHMAN 2025-DS-11

**Supervised by:**

Ms. Kashaf and Ms. Hijab

## Institute of Data Science

UNIVERSITY OF ENGINEERING AND TECHNOLOGY

LAHORE, PAKISTAN

# AICT (FRONTEND)

## Introduction to Project

**The Events and Clubs Management System** is a web-based application designed to help university manage student clubs and campus events efficiently. The system provides a centralized platform where students can discover clubs, view upcoming events, and register for activities they want to attend.

**Currently**, students miss important events and club activities because information is scattered across different platforms like WhatsApp groups, Facebook pages, and physical notice boards. Our system solves this problem by bringing everything together in one organized place.

The project combines both **frontend** and **backend** development. The frontend (AICT component) will provide an attractive and easy-to-use interface using HTML, CSS, JavaScript, and Bootstrap. The backend (PF component) will handle all the data management, user authentication, and business logic using Python, Flask framework, and SQLite database.

This system will benefit students by keeping them informed about campus activities, help club administrators organize their events better, and give university management a clear overview of all activities happening on campus.

9. Conclusion

## Introduction

This document presents the **AICT (frontend)** part of our semester project. The project is based on an **Events Management System** where students can view and register for events, and admins can manage those events through a simple interface.
The main focus of this frontend is usability. We designed the pages so that users can easily understand what to do without needing instructions. This section explains the purpose of the

project, the problems identified, and how our frontend helps in solving those problems from a user's point of view.

## Problem Identified

In many institutes, information about events is scattered. Students usually depend on notice boards, WhatsApp messages, or verbal announcements. This creates several problems:

- Students miss events because information is not delivered properly
- No single place to view all upcoming events
- Manual registration causes confusion and errors
- Admins find it difficult to manage event details and student registrations

Because of this, both students and organizers face communication gaps and poor coordination.

## Purpose of the Project

The purpose of our project is to provide a **single, easy-to-use platform** where:

- ❖ Admins can add, update, and manage events
- ❖ Students can view available events anytime
- ❖ Students can register for events without manual paperwork

The frontend acts as a bridge between users and the system. It focuses on clear layouts, simple forms, and consistent navigation so that users with basic computer knowledge can use the system without difficulty.

## How our Project Solves the Identified Problems

Our frontend solves the identified problems in the following ways:

- ➢ All events are displayed on one platform, reducing information loss
- ➢ Registration forms replace manual processes
- ➢ Dashboards separate admin and student functionalities to avoid confusion
- ➢ Validation ensures users enter correct and complete information

By using a clean interface and step-by-step flow, the system reduces mistakes and saves time for both students and administrators.

## Students Profile and Certifications

## Certifications:
## M.AMIR's Certificates:

HTML and CSS

JavaScript

**Abdul Rehman's Certificates:**

HTML

CSS

## AICT (Frontend) Overview

The frontend is the visible part of the project that users interact with. It contains separate pages for the admin and the student. All pages use the same layout (navigation bar and content area) so the look and feel stays consistent across the website.

We kept the design simple and focused on making features work reliably. Pages use background images for visual appeal and cards or lists to show events.

## Technologies Used in Frontend

Below are the technologies we used and how we used them in simple words:

- **HTML:** Used to build the pages, forms, buttons, input fields, and the structure of each page.
- **CSS:** Used to style pages, add background images, make the layout responsive, and design cards for events.
- **JavaScript:** Used only for basic interactivity such as validating forms before submitting, handling simple button clicks, and improving the user flow. We did not use any frameworks or libraries — just plain JavaScript for small tasks.

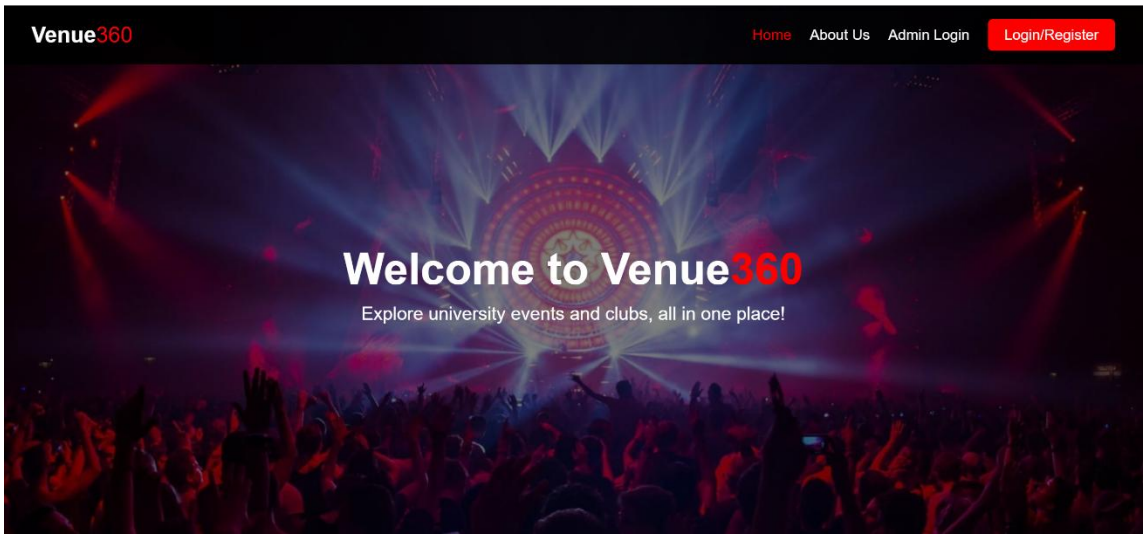

We avoided complicated tools to keep everything easy to explain in viva.

## Frontend Pages and Functionalities

This part lists every frontend page. For each page there is a screenshot placeholder, a short purpose statement, the main actions a user can do, and which frontend elements are used. When you add the screenshots, place them under the screenshot placeholder.

## Home Page

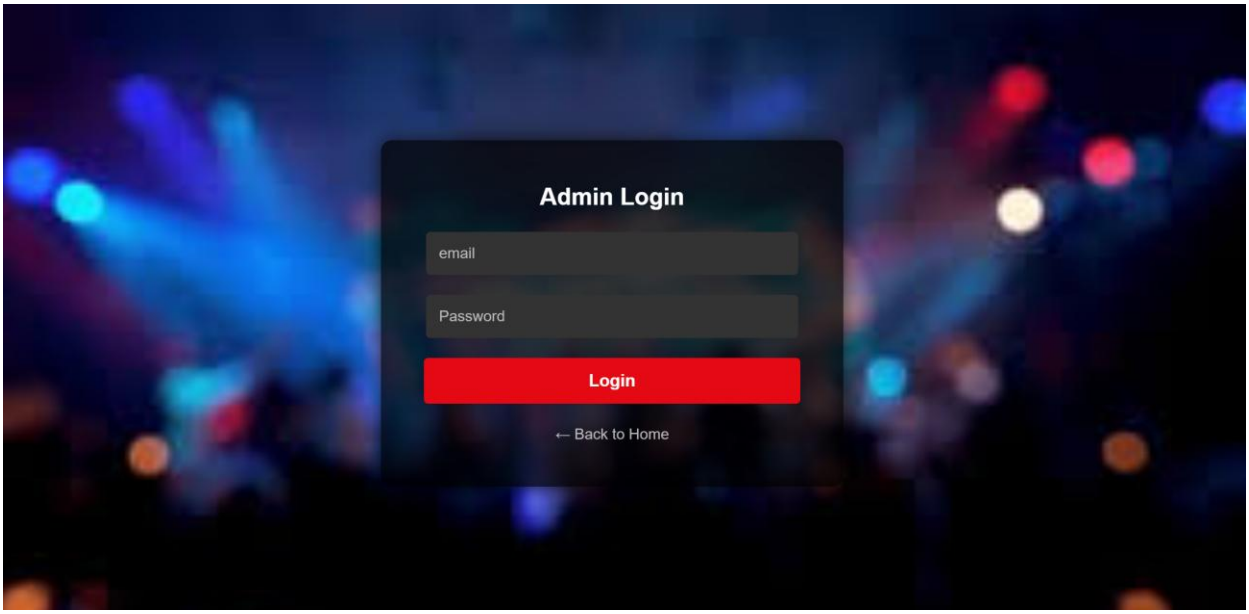

**Screenshot:**

**Purpose:** The first page users see. It gives links to login pages and a short idea about the system.
**What the user can do:** Click navigation links to go to admin or student login pages.
**Frontend elements:** Navigation bar, buttons/links, background image, simple header section.

## Admin Login Page

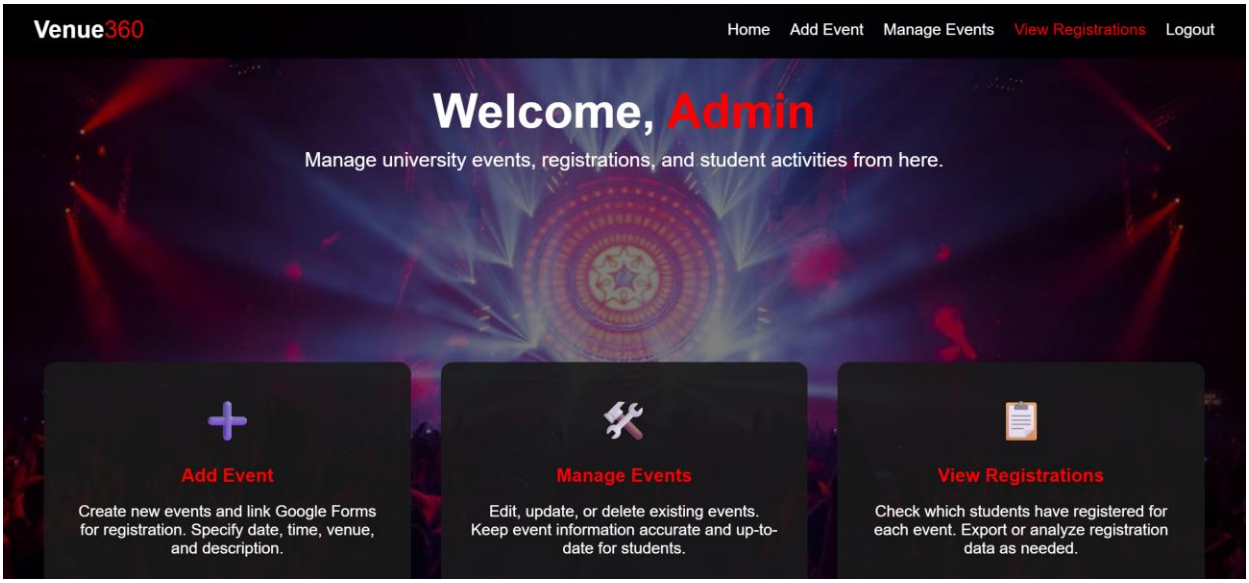

**Screenshot:**

**Purpose:** Allows the admin to enter credentials and move to the admin dashboard.
**What the user can do:** Enter username and password and press the login button.
**Frontend elements:** HTML form (input fields and submit button), small validation using HTML attributes, form styling with CSS.

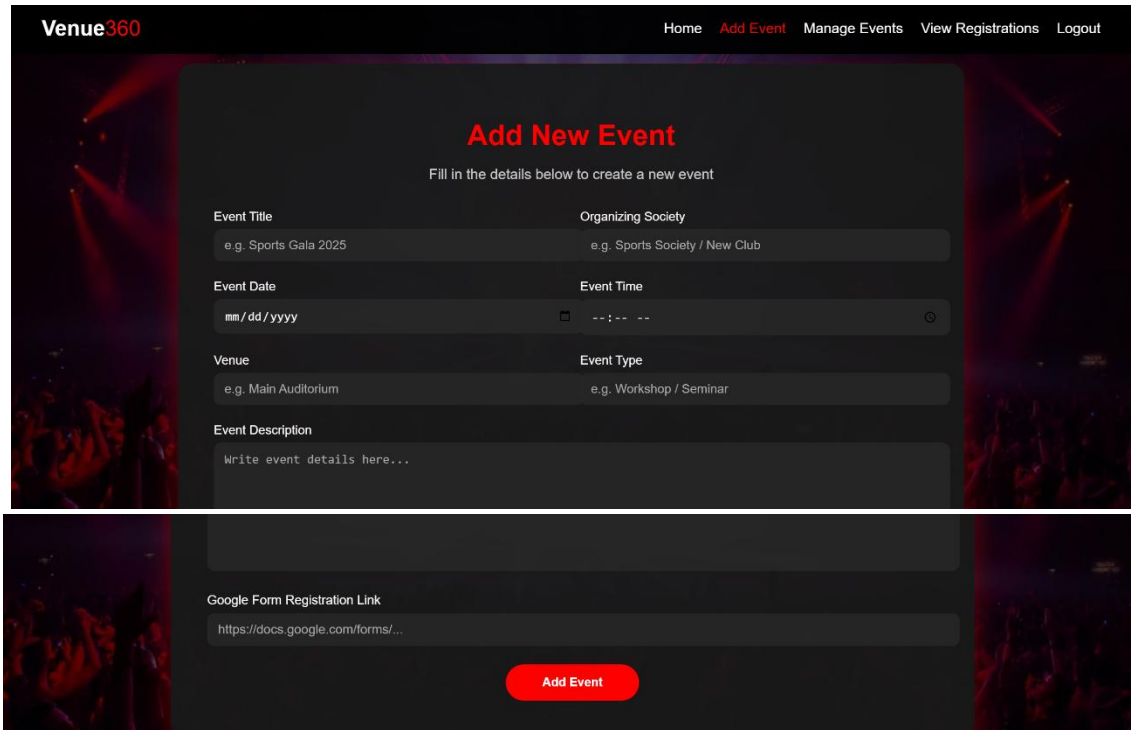

## Admin Dashboard

**Screenshot:**

**Purpose:** Main control area for the admin to manage events and see registrations.
**What the user can do:** Open Add Event form, go to Manage Events, and view all registrations.
**Frontend elements:** Navigation links/cards, buttons, dashboard layout styled with CSS.

## 6.4 Add Event Page

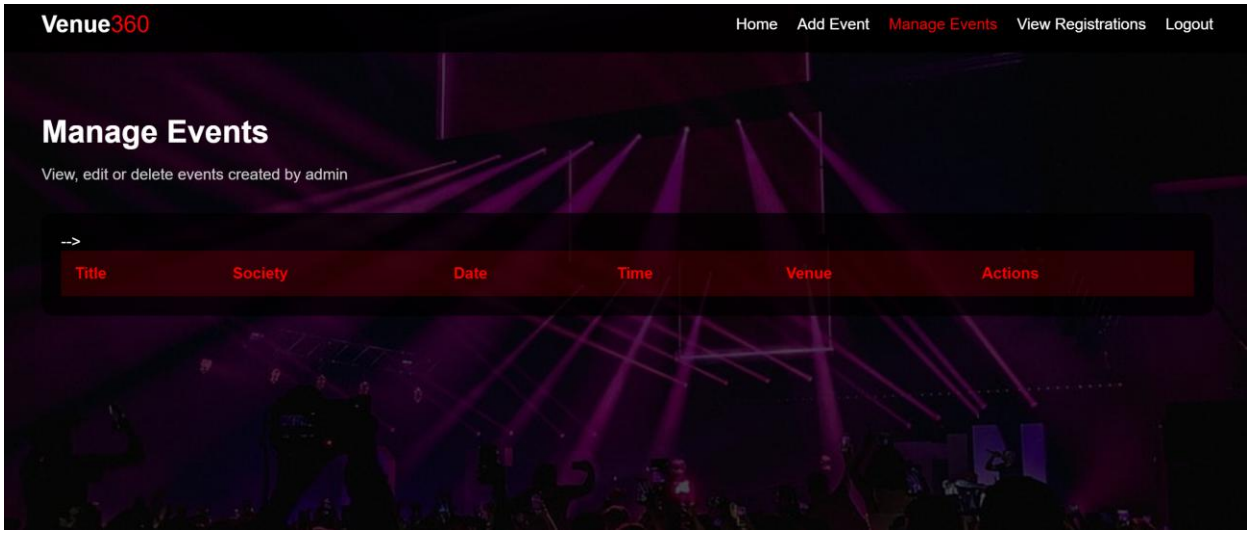

**Purpose:** Page where the admin fills in event details.
**What the user can do:** Fill fields like title, date, time, venue, and description, then submit the form.

**Frontend elements:** HTML form with required fields, submit button, and CSS spacing for a clean layout. Small JavaScript validation may be used to check the date format before sending.

## Manage Events Page

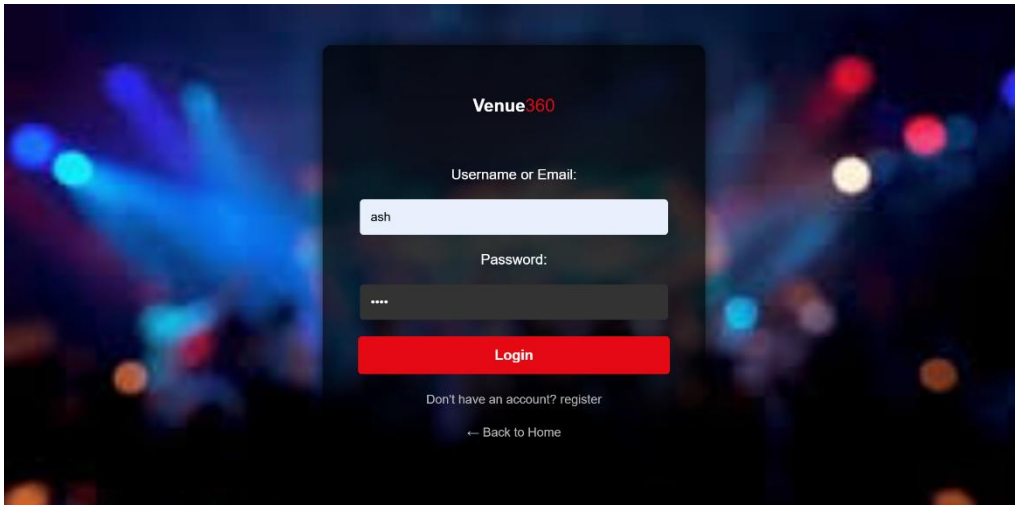

**Screenshot:**

**Purpose:** Shows a list of existing events and allows admin actions.
**What the user can do:** See events as cards or rows, choose to edit or delete an event.
**Frontend elements:** Cards or table layout, action buttons, and simple JavaScript to confirm delete actions.

## Student Login Page

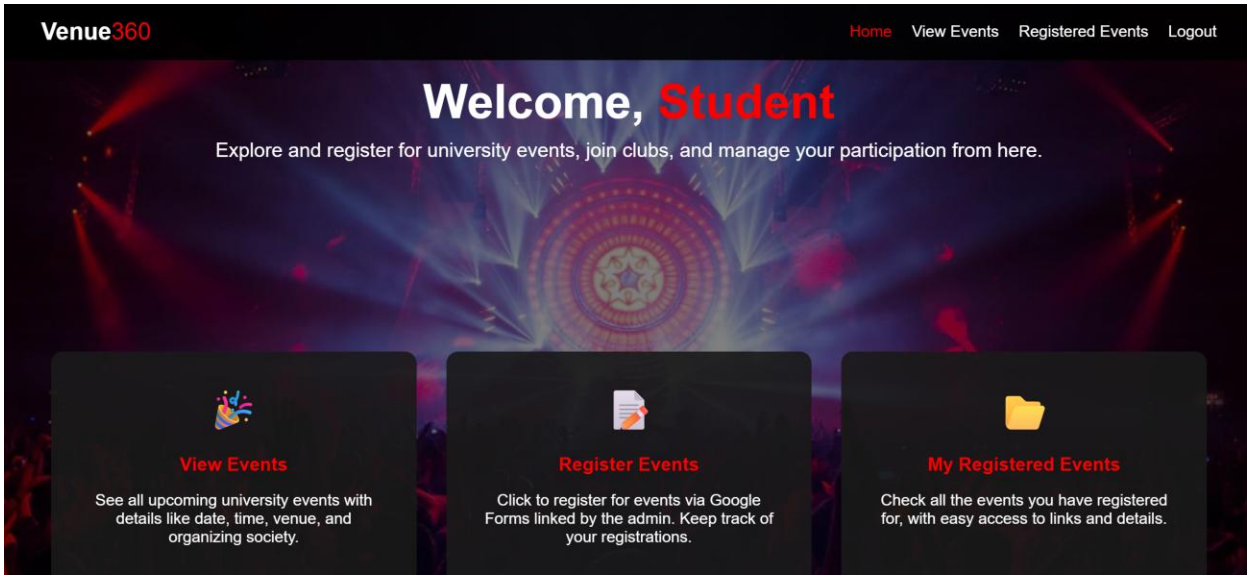

**Screenshot:**

**Purpose:** Lets students sign in or provide their name/email to use the student features.
**What the user can do:** Enter details and go to Student Dashboard.
**Frontend elements:** HTML form, CSS styling, and HTML validation.

## Student Dashboard

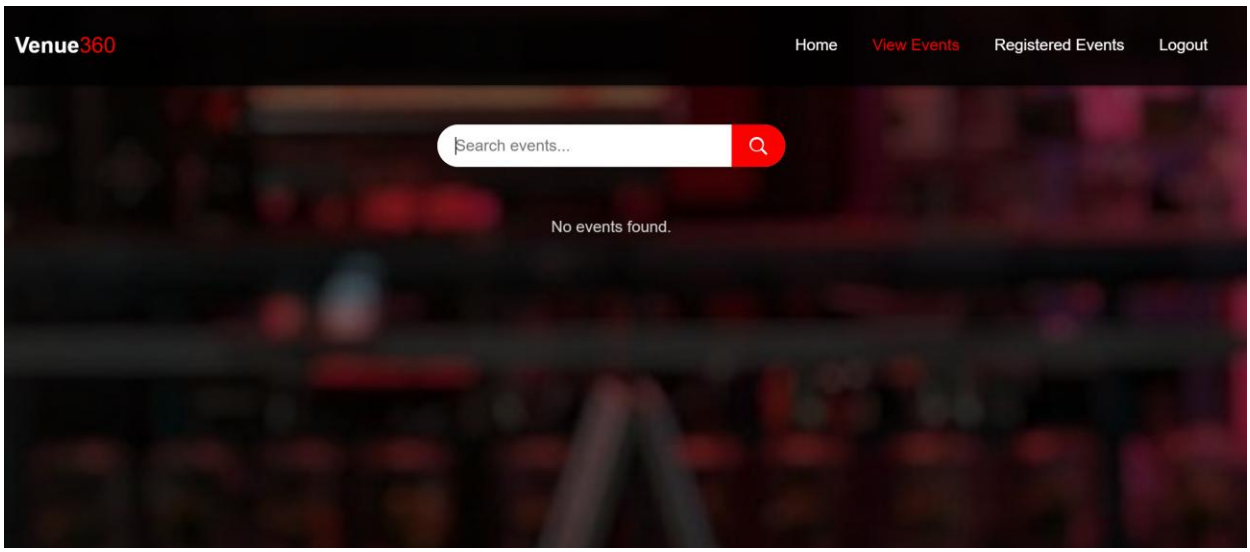

**Screenshot:**

**Purpose:** Student control area to view and register for events.
**What the user can do:** Browse events, open event details, register for events, and see registered events.
**Frontend elements:** Navigation links/cards, lists, and buttons styled with CSS.

## View Events Page

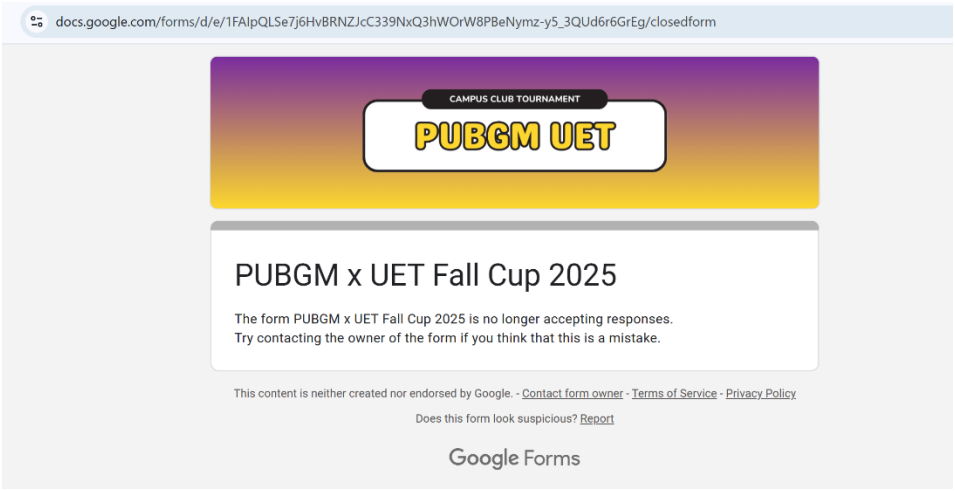

**Screenshot:**

**Purpose:** Displays all available events for students.
**What the user can do:** See event cards, read short descriptions, and press a register button.
**Frontend elements:** Cards, titles, short descriptions, and a register button on each card.

## Event Registration Method

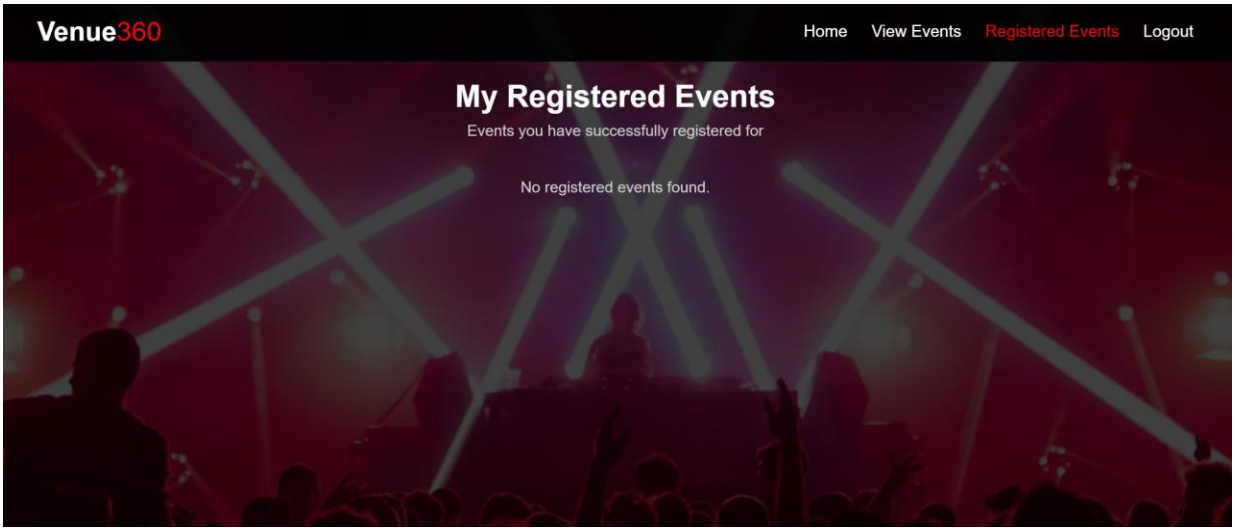

**Screenshot:**

**Purpose:** students will be redirect to the google form docs for registering the event.
**What the user can do:** Submit registration form and see a small confirmation message.
**Frontend elements:** simple validation.

## My Registered Events Page

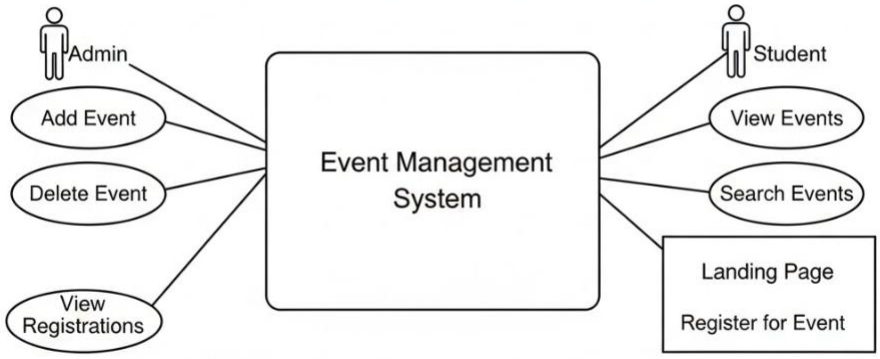

**Screenshot:**

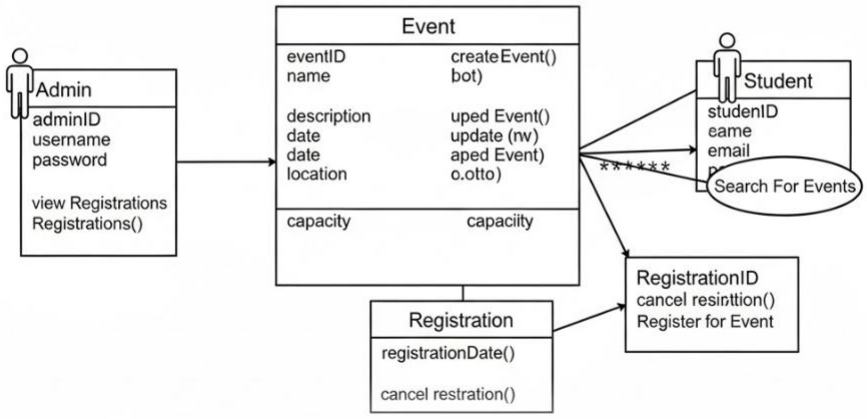

**Purpose:** Shows the student the events they have registered for.
**What the user can do:** View their list of registered events and check details.
**Frontend elements:** Lists or cards and basic styling with CSS.

## UML DIAGRAM:

## USE CASE Diagram:

## CLASS DIAGRAM:

## Frontend Navigation Flow

The site uses a common navigation bar on every page so users always know how to move between sections. The main flow is:

- Home → Login → Dashboard → (Add Event / View Events / Register / Registered Events)

This keeps navigation simple and predictable for both admin and students.

## Frontend Limitations and Notes

We were careful to keep the frontend honest and explainable. Some points to note:

- The project does not include event image uploads; events are shown with cards only.
- Validation is basic — mostly HTML validation and a few small JavaScript checks.

- ❖ We focused on being able to explain every stepin viva rather than adding fancy animations.

If time allows, we planned to add better validation and more UI polish, but this was not necessary for the semester requirements.

## Learn and Earn Perspective

This project gave us a chance to **learn by doing** and apply the concepts from our courses in a real scenario. While building the frontend for the Events Management System, we learned how to:

- Structure pages using **HTML**
- Design layouts and styles using **CSS**
- Add simple interactivity with **JavaScript**

At the same time, this project was like a **mini "earn" experience** because:

- We practiced **problem-solving** by figuring out how to show events clearly and handle registrations
- We improved **time management** by dividing tasks between team members
- We gained some **practical exposure** that goes beyond theory, understanding how a real system works for both admin and student roles
- We mad a **profile** at linkedIn and fiverr and uploaded a gig on freelancing platform.
- It gave us confidence to **present, explain, and demonstrate** the system, which is a valuable skill for future internships or job projects

Overall, this project turned our classroom learning into hands-on experience, teaching us not just the technical tools but also the workflow, challenges, and user-centered thinking needed to develop a functional system.

## Conclusion

Working on the frontend helped us understand how to structure web pages and how to make simple interfaces that users can use without confusion. By using HTML and CSS and a little JavaScript for interactivity, we made a clear, usable interface for admin and student roles.

This completes the AICT (frontend) section of the manual. Insert the screenshots in the placeholders and we can then review the text to make any final changes so it matches the images closely.
